

Recent publications have been warning consumers about the danger of using low cost snorkels.

One publication implies that there has been a flood of low cost snorkels onto the Australian market and that these snorkels cannot be relied upon to deliver the level of component performance and durability of a leading Australian snorkel manufacturer.

Ironman 4x4 agrees that without strict control of raw material or production processes, there is the potential that inferior snorkels could have serious consequences.

While it is not our job to comment on the quality of other products but due to the scare tactics made in the 4x4 press, it is important that Ironman 4x4 states the following information about Ironman Airforce Snorkels.

Ironman Airforce Snorkels are

- Manufactured from imported premium quality Exxon Mobil Polyethylene ( LLPDE )
- Rotationally molded from precise 2 piece CNC machined aluminium dies offering high quality and precise tolerance for fitment
- Not blended with inferior product during production.

The LLPDE material chosen for Ironman Airforce Snorkels is tested by Exxon Mobil for UV stabilisation, impact strength and stress crack resistance.

Exxon Mobil states the LLPDE used in Ironman Airforce Snorkels is ideal for rotational moulding for applications requiring excellent dimensional control and low warpage.

All Ironman Airforce snorkels come complete with installation hardware, detailed templates and fitting instructions as well as a 3 year warranty.
